

### **plastics extrusion technology handbook pdf**

Extrusion is a process used to create objects of a fixed cross-sectional profile. A material is pushed through a die of the desired cross-section. The two main advantages of this process over other manufacturing processes are its ability to create very complex cross-sections, and to work materials that are brittle, because the material only encounters compressive and shear stresses.

One important classification of plastics is by the permanence or impermanence of their form, or whether they are: thermoplastics or thermosetting polymers. Thermoplastics are the plastics that, when heated, do not undergo chemical change in their composition and so can be molded again and again. Examples include: polyethylene (PE), polypropylene (PP), polystyrene (PS) and polyvinyl chloride (PVC).

Introduction []. Blown film extrusion is a technology that is the most common method to make plastic W films, especially for the packaging industry. The process involves extruding a tube of molten polymer W through a die and inflating to several times its initial diameter to form a thin film bubble. This bubble is then collapsed and used as a lay-flat film or can be made into bags.

This paper reviews the current pathways for recycling of solid plastic waste, via both mechanical and chemical recycling. The predominant industrial technologies, design strategies and recycling examples of specific waste streams are reviewed.
